

LED Therapy (Light Emitting Diode)

LED light therapy is non-invasive, so no recovery time is required. You should be able to continue with your everyday activities once your treatment is over.

Light therapy, uses four clinically proven wavelengths of UV-free LED lights that penetrate your skin at different depths and cause various reactions in your skin such as boosting collagen production, treating existing acne or rosacea, promoting wound healing, reducing inflammatory conditions and fading away dull skin.

This light therapy requires up to 10 sessions or more for optimal results depending on the severity of the condition, spaced out about a week apart. You may start to see minor results after your first session. Results will be more dramatic and noticeable once you've finished all of your treatments.
