

Microdermabrasion

This is a minimally invasive procedure used to make subtle changes and improvement in the appearance of sun damage, wrinkles, fine lines, age spots, acne scarring, melasma, and other skin-related concerns and conditions, with no skin colour change or scarring.

During microdermabrasion, the small tube is placed on your skin which will simultaneously vacuum in your skin during the strikes. Think of this as working like a high-powered mechanical scrub.

Microdermabrasion is considered a safe procedure for most skin types and colours. Just one treatment leaves the skin feeling soft, smooth, and looking radiant. It can be repeated at average intervals of two to four weeks for continued improvement. Usually, multiple treatments (six to 12 sessions) are recommended to see a noticeable improvement.
